

SonarQube Findings

File: `service.js`

Issue Identified

Rule: `prefer-node-protocol`

Category: Code Quality / Best Practice

Severity: Code Smell

Description

SonarQube flagged the following import:

```
const { exec }=require("child_process");
```

Problem

Node.js built-in modules should be imported using the `node:` protocol prefix to clearly indicate that they are core modules:

```
require("node:child_process");
```

Reason for Detection

SonarQube raises this issue because:

- It improves clarity by explicitly identifying built-in modules.
 - It prevents potential dependency confusion attacks.
 - It aligns with modern Node.js standards.
 - It has been recommended since Node.js 12.20+.
-

Impact

- No direct security vulnerability.
 - Possible ambiguity between core modules and third-party packages.
 - Maintainability and readability concern.
-

Recommended Fix

```
const { exec }=require("node:child_process");
```
